

# INTRODUCTION

This project has been made based on the Python Programming language. Python was developed by Guido Van Rossum in February 1991. It is an easy-to-learn yet powerful object-oriented programming language.

Some advantages of Python are that it is very programmer friendly, requires simpler syntax and fewer lines of code, has various modules in its standard library and is a cross-platform free and open-source language. It is also an interpreted language making it easier to debug your code.

*Arcade* is a project that has two online multiplayer games. It aims to provide users with an opportunity to enjoy classical games we have all played but in a digital form. We aim to provide a smooth experience with an easy-to-understand interface. The games are supported by a lobby-room system that allows multiple groups to play at the same time. A leaderboard and stats tracker enhances the user experience. The app allows a large degree of customization both in terms of user profile and game settings. One notable feature is the option of light/dark mode. The app also keeps track of login sessions which logs out the user if they have been inactive for too long.

# THEORY

This project is an implementation of a multiplayer arcade. We offer two games, *Monopoly* and *Chess*. On opening the app, the starting screen is shown, which has the option to login or register. Every user account has a custom profile picture which can be changed along with the password. On logging in, there are two lobbies, one for each game. Each lobby has the user's stats and a global leaderboard on the sides with the option of joining or creating a room. During room creation, the host can modify the game settings. To join a room the user can choose from the list of public rooms or enter a private room code.

In Chess, the initial sides can be picked along with the duration of the game and the seconds of increment per turn. Along with facilitating normal chess play, it also has the option of requesting a draw or resigning.

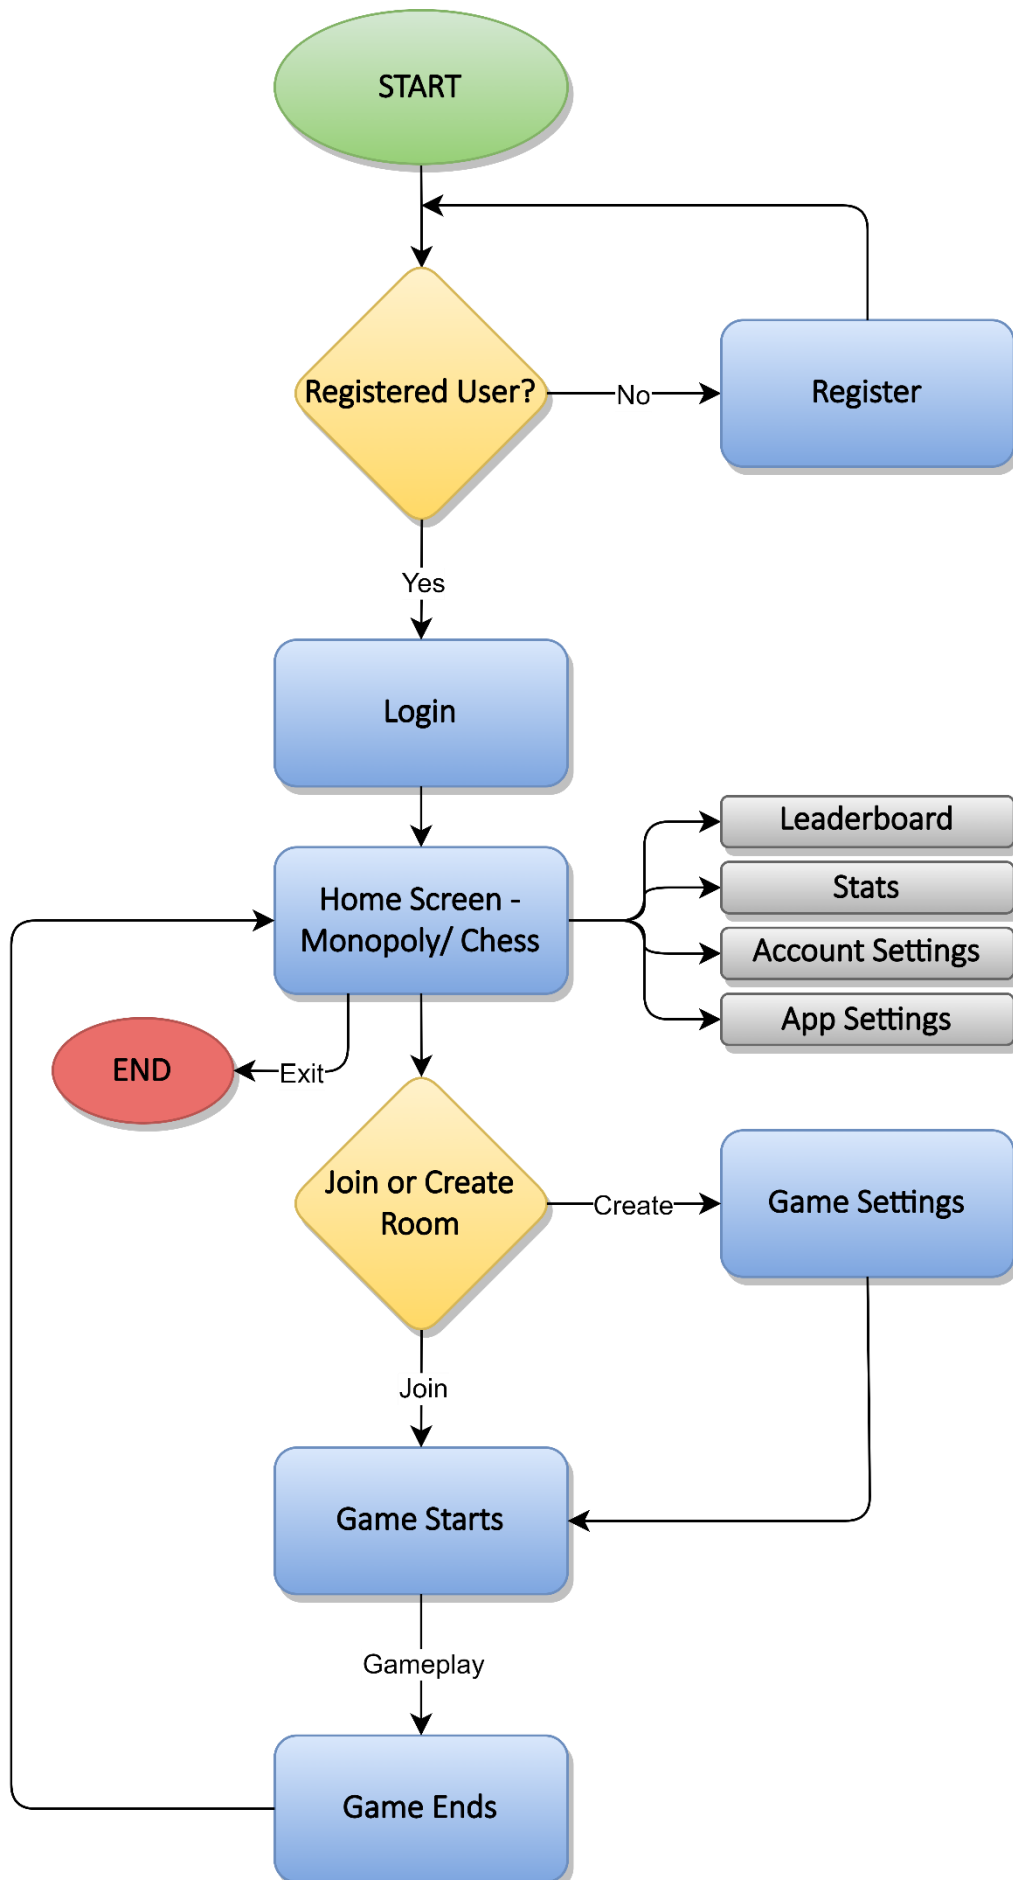

In Monopoly, the maximum number of players can be picked initially. The frames on the right side display game and player details which changes as the game progresses. Players can build houses, mortgage and sell their properties. They can also trade properties and money amongst them. The game can be ended by majority vote, forfeiture or until all but one player is bankrupt. An inactivity timer is implemented to automatically end turn if a user doesn't take action in a set time.

The front-end's GUI was implemented through Tkinter and Tcl, while threading enables multiple tasks to run simultaneously. The room and game events are communicated over custom protocol built on top of TCP. The authentication, profile pictures and stats are handled by an API written in Flask. The project uses MySQL to store user information and stats. Despite the variety, this project is written entirely in python.

# SYSTEM DESIGN

1. ***pillow***: Image Handling
2. ***plyer***: Displaying Notifications
3. ***pygame***: Playing Audio
4. ***pyperclip***: Copying text to system clipboard
5. ***requests***: Making Authentication API calls
  
6. ***tkinter***: Graphic User Interface
7. ***socket***: Communicating between Multiple Clients and Server
8. ***mysql.connector***: Accessing Users and Games databases
9. ***threading***: Running multiple processes simultaneously
10. ***random***: Randomising items in various places
11. ***time***: Keeping track of time for in-game timers
  
12. ***flask***: Implementing the authentication API
13. ***redis***: Local cache for storing users' sessions
14. ***secrets***: Generating string ids for users' sessions
15. ***datetime***: Storing users' date and time joined
16. ***bcrypt***: Hashing the users' passwords to be stored securely
  
17. ***pickle***: Serializing python objects to be transferred over TCP
18. ***json***: Converting HTTP responses to python objects and vice versa
19. ***dotenv***: Accessing the local environment variables
20. ***io, base64***: Serializing images to transfer between clients
21. ***copy***: Making deep copies of lists and dictionaries
22. ***os, sys***: Managing Files and OS Paths
  
23. ***Arcade***: Driver Class for initialising the app
24. ***Chess***: Handling Chess Processes
25. ***Monopoly***: Handling Monopoly Processes
26. ***Theme***: Changing and Saving Dark/ Light Themes
27. ***HTTP***: Wrapping access to the API

EXIT GAME

## **LIMITATIONS**

1. Possible incompatibility with lower versions of python.
2. Low to nil support for other operating systems such as macOS.
3. Tkinter GUI may not be as intended if used on a monitor with a screen width to height ratio different than approx. 1.7.
4. When disconnected, the user cannot return to the ongoing game.
